

Stacked layers of materials such as printed glass screen, stone, metal, lattice handrail, etc., it is to form a multi-layered facade

Form a human scale townscape with a two-layered structure

Entrance with artworks

Gallery-like shared hallway with paintings

PROUD Shirokanedai

Year of Completion : 2016
 Location: Shirokanedai 5-11-11, Shinagawa, Tokyo, Japan
 Use : Apartment Building
 Site Area: 1,066.80 m²
 Building Area: 634.66 m²
 Total Floor Area: 3,900.04 m²
 Structure : Reinforced Concrete
 Volume : 6 stories above ground level and 2 stories below ground level

Platinum-dori, which is located near the site, has many buildings that gently open into the street, creating an attractive spatial experience, though the street facing the site of this project is lined with buildings that have enclosed exterior. Therefore, it is aimed to design an urban apartment building that opens to the street while maintaining privacy, as well as connects to the street and eventually forms the townscape.

By stacking layers of bright and transparent materials such as randomly arranged printed glass screens and aluminum handrails which the shape is determined to control the sight line, it forms a gentle façade that matches the spatial image of Shirokanedai while maintain privacy.

In addition, the core, which is placed between every two dwelling units, creates an entrance space with high privacy. Also with such placement of the core, all dwelling units enjoy the vast nature of the Institute of Nature Study adjacent to the site, enabling them to have wind blowing from both north and south.
